HOW TO LOSE FAT IN 3 STEPS

During my time personal journey my views and understandings regarding fitness and health have changed **DRASTICALLY**. The one area where my understanding has changed the most is in regards to fat loss. In fact, how I train now and how I approach fat loss is so different today vs years ago that the average person may think I might have lost my mind.

The truth is I haven't lost my mind. You see I like fitness a lot. It's my favourite hobby, by far...but it's not my passion. My true passion is **PEOPLE** and when you love to work with and help people as much as I do, it compels you to examine common knowledge and dogma. It urges you to cut through the myths. And let me tell you...the fitness industry is full of it.

THE ULTIMATE GUIDE OF HOW TO LOSS FAT

When I first got into fitness, my understanding of fat loss was based on simple math. Calories in vs calories out. I learned through certification courses that if you wanted to lose weight all you had to do was eat less and move more. If someone wanted to lose weight I would just have them do a lot of cardio and tell them to eat less. It is SO SIMPLE! Or is it?

Its true that cardiovascular activity burns more calories per time spent than any other form of exercise. It's true that while you do cardio you burn more fat vs any other type of exercise. Those statements are true AND THEY ARE ALSO THE PROBLEM.

When you exercise or move you burn calories but you also send a SIGNAL to the body. The signal tells the body to ADAPT. This is because exercise stresses the body and they body is always trying to mitigate any stress by becoming more resilient or efficient to this stress so that next time the same exercise doesn't cause the same stress. This is true for all of the adaptation processes of the body.

Okay, so lets look at cardio and understand it from that same perspective. Cardio causes a LOT of calorie burn, which is a stress on the body. It's a stress because your primitive body evolved from thousands of generations of people who lived during times of food scarcity. Burn too many calories and you may actually STARVE the body. Cardio the "signal" tells the body to "adapt" by becoming MORE EFFICIENT with calories. In other words you SLOW YOUR METABOLISM DOWN in a short period of time.

This isn't just my theory either. It's been observed in athletes many times, by scientists and medical experts. An athlete will actually burn LESS calories as their bodies become "better" at doing cardio. This happens to you as well.

That's not all though. Over time your body will burn less calories by reducing muscle mass (this is why endurance athletes carry such little muscle), it will change hormone profiles (this is why female endurance athletes stop menstruating) and it will change behaviors so that you move less when you don't exercise. Basically you end up shooting yourself in the foot and in a situation that usually leads to burn out and fat gain. Except this time your metabolism is slower than before. Sound familiar? Happens ALL THE TIME, especially to women. Probably because women tend to be more afraid to do the one form of exercise that will truly SPEED UP THE METABOLISM...they don't LIFT WEIGHTS.

Here is the first step to real, effective and long-term fat loss...LIFT SOME WEIGHTS. Now I don't mean do cardio with weights like you would with circuit classes or for super high reps. Those modalities of exercise will send a similar signal to the body as regular cardio does.

What you need to do is lift weights to BUILD and to GET STRONGER. By doing so you are sending a signal to the body that says "strength and muscle are a priority" and since traditional weight training doesn't burn a ton of calories during the process becoming "efficient" is an after thought. Lift weights PROPERLY and the result is a raging hot metabolism.

When I apply this with my clients the results are literally insane. Women who used to gain fat by eating over 1200 calories now can consume 1800-2000 calories and LOSE fat. While cardio is reduced to almost nothing as well.

This can work for you as well however there is one main caveat: all weight training exercise aren't the same. Some are extremely effective while others are almost a waste of time. In other words...

It wasn't that long ago that the fitness industry had a money problem. Gyms had no issue attracting men but women weren't exactly showing up in droves. And why would they? Weights made people look like body builders and most women wanted NOTHING to do with looking like Arnold Schwarzenegger. Women also make up the majority of consumers in almost any market so if gyms wanted to make real money they had to figure out how to attract the female consumers. So they invented some new words and exercises that were "just for women".

Raise your hand if you want to build tons of bulky muscle. I bet very few or none of you raised your hand. Now raise your hand if you want a really toned body. Ahh...there you all are. Guess what? Toning is a MADE UP WORD. The fitness industry made it up to get women to buy gym memberships. Muscles don't tone. They either build (hypertrophy) or they shrink (atrophy). The "hard" feeling you get in your muscles is just a small degree of building.

Not only did the fitness gym industry make up the word "tone" they also made up new methods of resistance training, since the ways that most men lifted weights built muscle. In other words gyms said "use resistance this way and you don't have to worry. You won't build big muscles, you will just tone." This is crazy once you fully understand the following: building muscle is HARD. It's hard for men and they have much more of the muscle building testosterone in their system than females do.

For women it's even harder. In fact, I dare you to try to build muscles like a body builder (without taking steroids) and watch what happens. You will just get really "TONED". The exercises that are the MOST effective for muscle building are the exercise you should do the most of. Forget all the "female" exercises like the bodyweight leg kickbacks or the short choppy high reps exercise classes. Instead do the most effective muscle building exercises known to man. Do barbell squats, deadlifts, bench presses, rows, lunges, curls and overhead triceps extensions. Also...use heavy weight. High reps DON'T build muscle very well at all. Train like you want to build and you will send a powerful signal to your body which will result in a faster metabolism, a sculpted hard body and an ability to get away with the occasional high calorie food day.

Here it is: a basic template that will work far better than most other “fat burning” workouts that are geared and advertised towards women. Keep in mind doing things the right way will get your body to respond quickly, but not with fat loss. At first you will feel and look stronger, but as you continue your metabolism will speed up and fat loss will seem almost “effortless” and it will stay that way.

- Barbell Squats
- Lunges
- Barbell Bench Press
- Barbell Rows
- Overhead Press
- Dumbbell Curls
- Bench Dips
- Reverse Crunches

BASIC FAT BURNING METABOLISM BOOSTING ROUTINE

That it. Do each exercise for 8-12 reps with a moderate to high intensity but don't lift to failure. In other words use a weight that is very challenging but not so challenging that you can't move the day after. Do 3 sets of each exercises and rest in between sets for 30-90 seconds. Resting between sets is very important. Follow the above routine and watch how quickly you gain strength and remember: each time you get stronger it means your metabolism is speeding up. You will start to sleep better, libido will boost and your body will look and feel harder. These are all great signs. Stay consistent and eat a good diet and over a relatively short period of time you will have the lean tight body that was so elusive before...only this time, it'll take half the work.

THANK YOU!

First off, congratulations for downloading and making it to the end of this guide! Taking the time to invest in your knowledge is the first step toward better health and fitness.

I truly hope the information in these pages helps you move the needle on your fitness goals today. But I also know that, sometimes, a PDF can only take you so far. Most successful, sustainable change happens when a plan is built specifically for your life, your body, and your long-term goals.

That is why I founded Lift2Last. We focus on:

- Personalised 1-on-1 coaching that is tailored to you
- Building functional strength that promotes longevity and boosts your energy
- Combining efficient digital tools with real human support to guide you through the tough moments and inspire true confidence.

If you are tired of putting in your best efforts but are not seeing the results you deserve, let's talk. I want to help you build a strategy that is actually made for you.
